

Assignment-6

Nwjwr Khungur Brahma (AI20BTECH11016)

Question: A man is known to speak truth 3 out of 4 times. He throws a die and reports that it is a six. Find the probability that it is actually a six.

Solution: Let the event that the man reports the actual six be $E = 1$ and lies as six be $E = 0$.

The event that six actually occurs on the die be $X = 1$ and $X = 0$ be the event that six does not occur.

Then,

Description of event	Events
Die rolls the number six	$X=1$
Die does not roll the no. six	$X=0$
Man speaks truth	$E=1$
Man does not speak truth	$E=0$

$$\text{Probability that die rolls six} = P(X = 1) = \frac{1}{6} \quad (1)$$

$$\text{Probability that die does not roll six} = P(X = 0) = \frac{5}{6} \quad (2)$$

Probabilities when the man reports the result to be six,

$$\text{Probability that six actually occurs} = P(E = 1|X = 1) = \frac{3}{4} \quad (3)$$

$$\text{Probability that it is not a six} = P(E = 0|X = 0) = \frac{1}{4} \quad (4)$$

Now by Bayes's Formula we get,

Probability that the man reports the result to be six is actually a six,

$$P(X = 1|E = 1) = \frac{P(X = 1) \times P(E = 1|X = 1)}{P(X = 1) \times P(E = 1|X = 1) + \dots} \quad (\text{cont.}) \quad (5)$$

$$= \frac{1}{\dots + P(X = 0) \times P(E = 0|X = 0)} \quad (6)$$

Now using the values from (1), (2), (3) and (4),

$$P(X = 1|E = 1) = \frac{\frac{1}{6} \times \frac{3}{4}}{\left(\frac{1}{6} \times \frac{3}{4}\right) + \left(\frac{5}{6} \times \frac{1}{4}\right)} \quad (7)$$

$$= \frac{\frac{3}{24}}{\frac{3}{24} + \frac{5}{24}} \quad (8)$$

$$= \frac{\frac{3}{24}}{\frac{8}{24}} \quad (9)$$

$$= \frac{3}{8} \quad (10)$$
